Fragenstellung/ Hypothese

- Inwiefern beeinflusst die explizite Kennzeichnung von Bildern als „von KI generiert“ im Vergleich zu „von menschlichen Künstler*innen“ die wahrgenommene Kreativität und Originalität?
- KI-generierte Bilder werden als weniger kreativ und originell eingeschätzt als menschlich zugeschriebene Bilder.

Can Artificial Intelligence Make Art?

Folk Intuitions as to whether AI-driven Robots Can Be Viewed as Artists and Produce Art

Elzè Sigutė Mikalonytė *
Institute of Philosophy, Vilnius University, elze.mikalonyte@fsf.vu.lt

Markus Kneer
Department of Philosophy, University of Zurich, markus.kneer@uzh.ch

In two experiments (total N=693) we explored whether people are willing to consider paintings made by AI-driven robots as *art*, and robots as *artists*. Across the two experiments, we manipulated three factors: (i) agent type (AI-driven robot v. human agent), (ii) behavior type (intentional creation of a painting v. accidental creation), and (iii) object type (abstract v. representational painting). We found that people judge robot paintings and human paintings as art to roughly the same extent. However, people are much less willing to consider robots as artists than humans, which is partially explained by the fact that they are less disposed to attribute artistic intentions to robots.

CCS CONCEPTS • Human-centered computing ~Human computer interaction (HCI) ~Empirical studies in HCI • Applied Computing ~Arts and humanities ~Fine arts • Computing methodologies ~Artificial Intelligence ~Philosophical/theoretical foundations of artificial intelligence ~Cognitive science

Additional Keywords and Phrases: artificial intelligence, creativity, aesthetics, AI art, mental states

Investigating how people respond to and view AI-created artworks is
becoming increasingly crucial as the technology's current application spreads
due to its affordability and accessibility. This study examined how AI art
alters people's evaluation, purchase intention, and collection intention toward
Chinese-style and Western-style paintings, and whether art expertise plays a
role. Study 1 recruited participants without professional art experience (non-
experts) and found that those who made the paintings would not change their
liking rating, purchase intention, and collection intention. In addition, they

INDIAN PSYCHOLOGY

Perception and Evaluation of AI Generated Art

Siddhant Yadav^{1*}

ABSTRACT

Background: This research navigates the evolving landscape of human-AI interaction, exploring key dimensions of perception in the burgeoning era of artificial intelligence (AI). Delving into trust, ethical concerns, industrial impact beliefs, and image complexity, the study seeks to unravel how individuals attribute creative authorship to AI-generated content. **Methods:** Employing rigorous quantitative analysis, this study investigates diverse perceptual facets with a sample of 124 participants. Statistical methods, including t-tests, correlation analysis, and effect size measures, were employed to scrutinize participants' attitudes and behaviors towards AI-generated images in response to varying perceptual factors with the help of Likert scale and AI-generated images. **Results:** The study unravels critical insights. Trust in AI-based recommendations surprisingly did not significantly affect participants' attributions of AI-generated images, revealing nuanced dynamics in trust perception. Additionally, heightened ethical concerns notably increased the likelihood of

Chancen, Herausforderungen und Einschränkungen

– Chancen:

- hohe Praxisrelevanz
- Zugänglichkeit

– Herausforderung:

- Stimulus-Äquivalenz
- Teilnehmenden-Bias

– Einschränkung:

- Fokus auf explizite Kennzeichnung
- Begrenzung auf visuelle Urteile
- Zeitpunkt- und Kulturabhängigkeit
